# Fixed Priority Scheduling Real-Time Operative Systems Course

Paulo Pedreiras, DETI/UA/IT

November 10, 2021

- Preliminaries
- 2 Online scheduling with fixed priorities
- 3 Schedulability tests based on utilization
- 4 Response time analysis

### Last lecture

- The concept of temporal complexity
- Definition of schedule and scheduling algorithm
- Some basic scheduling techniques (EDD, EDF, BB)
- The static cyclic scheduling technique

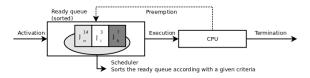

### Agenda for today

### Fixed-priority online scheduling

- Rate-Monotonic scheduling
- Deadline-Monotonic and arbitrary priorities
- Analysis:
  - The CPU utilization bound
  - Worst-Case Response-Time analysis

- Preliminaries
- Online scheduling with fixed priorities
- 3 Schedulability tests based on utilization
- Response time analysis

- The schedule is built while the system is operating normally (
   online ) and is based on a static criterium (priority)
- The ready queue is sorted by decreasing priorities.
   Executes first the task with highest priority.
- If the system is preemptive, whenever a task job arrives to the ready queue, if it has higher priority than the one currently executing, it starts executing while the latter one is moved to the ready queue
- Complexity: O(n)

### Pros (with respect to Static Cyclic Scheduling)

- Scales
- Changes on the task set are immediately taken into account by the scheduler
- Sporadic tasks are easily accommodated
- Deterministic behavior on overloads
  - Tasks are affected by priority level (lower priority are the first ones)

### Cons (with respect to Static Cyclic Scheduling)

- More complex implementation (w.r.t. static cyclic scheduling)
- Higher execution overhead (scheduler + dispatcher)
- Requires a kernel with support to fixed priorities
- On overloads (e.g. due to SW errors or unpredicted events) an higher priority tasks may block the execution of lower priority ones

#### Rules for priority assignment to tasks

- Inversely proportional to period (RM Rate Monotonic)
  - Optimal among fixed priority scheduling criteria if D=T
- Inversely proportional to deadline (DM Deadline Monotonic)
  - Optimal if  $D \leq T$
- Proportional to the task importance
  - Typically reduces the schedulability not optimal
  - But very common is industry cases e.g. automotive CAN

### Schedulability tests

- As the schedule is built online it is fundamental to know a priori if a given task set is schedulable (i.e., its temporal requirements are met)
- There are two basic types of schedulability tests:
  - Based on CPU utilization rate
  - Based on response time

- Preliminaries
- 2 Online scheduling with fixed priorities
- 3 Schedulability tests based on utilization
- 4 Response time analysis

# RM Scheduling

Schedulability tests for RM based on task utilization

- Valid with preemption, n independent tasks, D=T
- Liu&Layland's (1973), Least Upper Bound (LUB)

$$U(n) = \sum_{i=1}^{n} \frac{C_i}{T_i} \le n \cdot (2^{\frac{1}{n}} - 1) \Rightarrow$$
 One execution per period guaranteed

• Bini&Buttazzo&Buttazzo's (2001), Hyperbolic Bound

$$\prod_{i=1}^{n} \left( \frac{C_i}{T_i} + 1 \right) \leq 2 \Rightarrow$$
 One execution per period guaranteed

# RM Scheduling

### Interpretation of the Liu&Layland test

 $U(n) > 1 \Rightarrow \text{ task set not schedulable (overload)} - \text{ necessary condition}$ 

$$U(n) \le U_{lub} \Rightarrow \text{ task set is schedulable} - \text{ sufficient condition}$$

$$1 \ge U(n) \ge U_{lub} \Rightarrow$$
 the test is **indeterminate**

#### Some *U<sub>lub</sub>values*

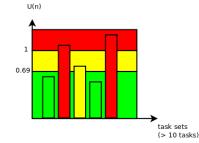

• 
$$U_{lub}(1) = 1$$

• 
$$U_{lub}(2) = 0.83$$

• 
$$U_{lub}(3) = 0.78$$

• ...

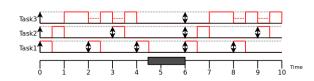

• 
$$U_{lub}(n) \rightarrow ln(2) \approx 0.69$$

# RM Scheduling – example 1

### Task properties

$\tau$	С	Т
1	0.5	2
2	0.5	3
3	2	6

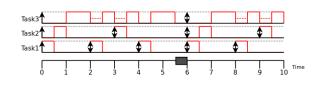

- $U = \frac{0.5}{2} + \frac{0.5}{3} + \frac{2}{6} \approx 0.75$
- $U_{lub}(3) = 0.78$ . As 0.75 < 0.78 one execution per period is guaranteed

# RM Scheduling – example 2

#### Task properties

Same task set, but  $C_3$  increases from 2 to 3 tu.

au	C	Т
1	0.5	2
2	0.5	3
3	3	6

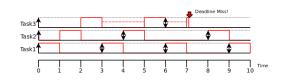

- $U = \frac{0.5}{2} + \frac{0.5}{3} + \frac{3}{6} \approx 0.92$
- $U_{lub}(3) = 0.78$ . As 0.92 > 0.78 one execution per period is **NOT guaranteed**
- But the task set is schedulable (see Gantt chart)

# RM Scheduling – example 3

#### Task set properties

$\overline{\tau}$	С	Т
1	1	3
2	1	4
3	2.1	6

- $U = \frac{1}{3} + \frac{1}{4} + \frac{2.1}{6} \approx 0.93$
- $U_{lub}(3) = 0.78$ . As 0.93 > 0.78 one execution per period is **NOT guaranteed**
- And the task set indeed is **not schedulable** (see Gantt chart)

# RM Scheduling - Harmonic Periods

Particular case: if the task **periods are harmonic** then the task set is schedlable iif  $U(n) \le 1$ 

• E.g.  $\Gamma = \{(1,2); (2,4)\}$ 

# Deadline Monotonic Scheduling DM)

### Schedulability tests for DM

- In some cases tasks may have large periods (low frequency) but require a short response time.
- In these cases we assign a deadline shorter than the period, and the scheduling criteria is the deadline.
- It is possible to use utilization-based tests.
  - The adaptation is simple, but the test is very pessimistic .

#### Utilization-based test

$$\sum_{i=1}^n \left(\frac{C_i}{D_i}\right) \leq n(2^{\frac{1}{n}}-1)$$

E.g.  $\{C = 0.5, T = 2, D = 1\}$  (Assumed utilization is doubled)

Preliminaries

- 2 Online scheduling with fixed priorities
- 3 Schedulability tests based on utilization
- Response time analysis

- For arbitrary fixed priorities, including RM, DM and others, the Response Time Analysis is an exact test (i.e., a necessary and sufficient condition) in the following conditions:
  - full preemption, synchronous release, independent tasks and  $D \leq T$
- Worst-case response time (WCRT, Rwc, R,...) = maximum time interval between arrival and finish instants.
  - $Rwc_i = max_k(f_{i,k} a_{i,k})$

### Schedulability test based on the WCRT

 $Rwc_i < D_i, \forall i \Leftrightarrow \text{task set is schedulable}$ 

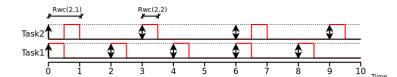

- The WCRT of a given task occurs when the task is activated at the same time as all other high-priority tasks (critical instant)
- $I_i$  interference caused by the execution of higher priority tasks

#### Computing Rwci

$$\forall i, Rwc_i = I_i + C_i$$

$$I_i = \sum_{k \in hp(i)} \lceil \frac{Rwc_i}{T_k} \rceil \cdot C_k$$

 $\lceil \frac{Rwc_i}{T_k} \rceil$  represents the number of activations of hp task "k"

The equation is solved iteratively. Stop conditions are:

- A deadline is violated
  - $Rwc_i(m) > D_i$
- Convergence (two successive iterations yield the same result)
  - $Rwc_i(m+1) = Rwc_i(m)$

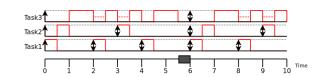

### Algorithm

$$Rwc_i(1) = \sum_{k \in hp(i)} \lceil \frac{Rwc_i(0)}{T_k} \rceil \cdot C_k + C_i$$

- **6** ...
- $Rwc_i(m) = \sum_{k \in hp(i)} \lceil \frac{Rwc_i(m-1)}{T_k} \rceil \cdot C_k + C_i$

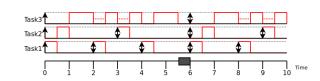

Repeat Step 3 until convergence or deadline violation

$\tau$	С	Т
1	0.5	2
2	0.5	3
3	3	6

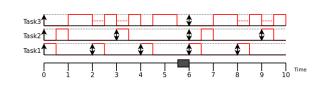

• 
$$Rwc_1 = ?$$

$\overline{\tau}$	С	Т
1	0.5	2
2	0.5	3
3	3	6

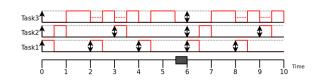

- $Rwc_1 = ?$ 
  - $Rwc_1(0) = C_1 = 0.5tu$
- $Rwc_2 = ?$

$\tau$	С	Т
1	0.5	2
2	0.5	3
3	3	6

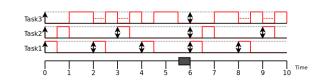

- $Rwc_1 = ?$ 
  - $Rwc_1(0) = C_1 = 0.5tu$
- $Rwc_2 = ?$ 
  - $Rwc_2(0) = C_1 + C_2 = 0.5 + 0.5 = 1tu$
  - $Rwc_2(1) = \sum_{k \in \{1\}} \lceil \frac{Rwc_i(0)}{T_k} \rceil \cdot C_k + C_2 = \lceil \frac{1}{2} \rceil \cdot 0.5 + 0.5 = 1tu$
  - Converged , thus  $Rwc_2 = 1tu$

$\tau$	С	Т
1	0.5	2
2	0.5	3
3	3	6
● Rwc <sub>3</sub> =?		

### Example:

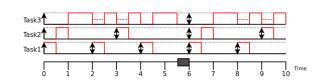

$\overline{\tau}$	С	Т
1	0.5	2
2	0.5	3
3	3	6

• Rwc<sub>3</sub>=?

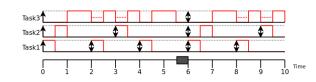

• 
$$Rwc_3(0) = C_1 + C_2 + C_3 = 4tu$$

$\overline{\tau}$	С	Т
1	0.5	2
2	0.5	3
3	3	6

- Rwc<sub>3</sub>=?
  - $Rwc_3(0)=C_1+C_2+C_3=4tu$
  - $Rwc_3(1) = \sum_{k \in \{1,2\}} \lceil \frac{Rwc_j(0)}{T_k} \rceil \cdot C_k + C_3 = \lceil \frac{4}{2} \rceil \cdot 0.5 + \lceil \frac{4}{3} \rceil \cdot 0.5 + 3 = 5tu$

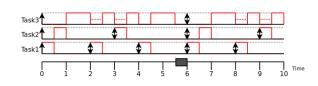

$\overline{\tau}$	С	Т
1	0.5	2
2	0.5	3
3	3	6

- Rwc<sub>3</sub>=?
  - $Rwc_3(0)=C_1+C_2+C_3=4tu$
  - $Rwc_3(1) = \sum_{k \in \{1,2\}} \lceil \frac{Rwc_i(0)}{T_k} \rceil \cdot C_k + C_3 = \lceil \frac{4}{2} \rceil \cdot 0.5 + \lceil \frac{4}{3} \rceil \cdot 0.5 + 3 = 5tu$
  - $Rwc_3(2) = \sum_{k \in \{1,2\}} \lceil \frac{Rwc_j(1)}{T_k} \rceil \cdot C_k + C_3 = \lceil \frac{5}{2} \rceil \cdot 0.5 + \lceil \frac{5}{3} \rceil \cdot 0.5 + 3 = 5.5tu$

#### Example:

$\overline{\tau}$	С	Т
1	0.5	2
2	0.5	3
3	3	6

- Rwc<sub>3</sub>=?
  - $Rwc_3(0)=C_1+C_2+C_3=4tu$
  - $Rwc_3(1) = \sum_{k \in \{1,2\}} \lceil \frac{Rwc_1(0)}{T_k} \rceil \cdot C_k + C_3 = \lceil \frac{4}{2} \rceil \cdot 0.5 + \lceil \frac{4}{3} \rceil \cdot 0.5 + 3 = 5tu$
  - $Rwc_3(2) = \sum_{k \in \{1,2\}} \lceil \frac{Rwc_i(1)}{T_k} \rceil \cdot C_k + C_3 = \lceil \frac{5}{2} \rceil \cdot 0.5 + \lceil \frac{5}{3} \rceil \cdot 0.5 + 3 = 5.5tu$
  - $Rwc_3(3) = \sum_{k \in \{1,2\}} \left\lceil \frac{Rwc_i(2)}{T_k} \right\rceil \cdot C_k + C_3 = \left\lceil \frac{5.5}{2} \right\rceil \cdot 0.5 + \left\lceil \frac{5.5}{3} \right\rceil \cdot 0.5 + 3 = 5.5tu$
  - Converged , thus  $Rwc_3 = 5.5tu$

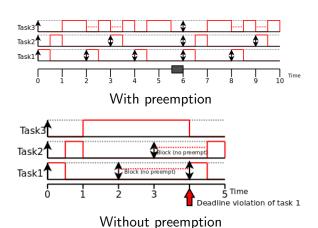

As  $Rwc(i) \leq D_i \forall i$ , the task set is schedulable!

### Restrictions to the schedulability tests previously presented

- The previous schedulability tests must be modified in the following cases:
  - Non-preemption
  - Tasks not independent
    - Share mutually exclusive resources
    - Have precedence constrains
  - It is also necessary to take into account the overhead of the kernel, because the scheduler, dispatcher and interrupts consume CPU time

### Impact of non-preemption

$\overline{\tau}$	С	Т
1	0.5	2
2	0.5	3
3	3	6

### Summary

- On-line scheduling with fixed-priorities
- The Rate Monotonic scheduling policy schedulability analysis based on utilization
- The Deadline Monotonic and arbitrary deadlines scheduling policies
- Response-time analysis
